```
#include <iostream>
using namespace std;

int init_m1(int m) { // Func. to init m1_
    cout << "Init m1_: " << m << endl;
    return m;
}

int init_m2(int m) { // Func. to init m2_
    cout << "Init m2_: " << m << endl;
    return m;
}

class X {
    int m1_; // Initialize 1st
    int m2_; // Initialize 2nd
public:
    X(int m1, int m2) :
        m1_(init_m1(m1)), // Called 1st
        m2_(init_m2(m2)) // Called 2nd
    { cout << "Ctor: " << endl; }
    ~X() { cout << "Dtor: " << endl; }
};

int main() { X a(2, 3); return 0; }
-----
Init m1_: 2
Init m2_: 3
Ctor:
Dtor:
```

```
#include <iostream>
using namespace std;

int init_m1(int m) { // Func. to init m1_
    cout << "Init m1_: " << m << endl;
    return m;
}

int init_m2(int m) { // Func. to init m2_
    cout << "Init m2_: " << m << endl;
    return m;
}

class X {
    int m2_; // Order of data members swapped
    int m1_;
public:
    X(int m1, int m2) :
        m1_(init_m1(m1)), // Called 2nd
        m2_(init_m2(m2)) // Called 1st
    { cout << "Ctor: " << endl; }
    ~X() { cout << "Dtor: " << endl; }
};

int main() { X a(2, 3); return 0; }
-----
Init m2_: 3
Init m1_: 2
Ctor:
Dtor:
```

- Order of initialization does not depend on the order in the initialization list. It depends on the order of data members in the definition

Program 14.02/03: A Simple String Class

Module 14

Sourangshu
Bhattacharya

Objectives &
Outline

Lifetime
Examples

String

Date

Rect

Name & Address

CreditCard

Copy
Constructor

Call by value

Signature

Data members

Free Copy
Constructor

Copy
Assignment
Operator

Copy Pointer

Self-Copy

Signature

C Style

```
#include <iostream>
using namespace std;

struct String {
    char *str_; // Container
    size_t len_; // Length
};

void print(const String& s) {
    cout << s.str_ << ": "
         << s.len_ << endl;
}

int main() {
    String s;

    // Init data members
    s.str_ = strdup("Partha");
    s.len_ = strlen(s.str_);

    print(s);

    return 0;
}

-----
Partha: 6
```

C++ Style

```
#include <iostream>
using namespace std;

class String {
    char *str_; // Container
    size_t len_; // Length
public:
    String(char *s) : str_(strdup(s)), // Uses malloc()
                    len_(strlen(str_))
    { cout << "ctor: "; print(); }
    ~String() {
        cout << "dtor: "; print();
        free(str_); // To match malloc() in strdup()
    }
    void print() { cout << "(" << str_ << ": "
                  << len_ << ")" << endl; }
    size_t len() { return len_; }
};

int main() {
    String s = "Partha"; // Ctor called
    s.print();
    return 0;
}

-----
ctor: (Partha: 6)
(Partha: 6)
dtor: (Partha: 6)
```

• Note the order of initialization between `str_` and `len_`. What if we swap them?

Program 14.04: A Simple String Class – Fails for wrong order of data members

Module 14

Sourangshu
Bhattacharya

Objectives &
Outline

Lifetime
Examples

String

Date

Rect

Name & Address

CreditCard

Copy

Constructor

Call by value

Signature

Data members

Free Copy
Constructor

Copy
Assignment
Operator

Copy Pointer

Self-Copy

Signature

```
#include <iostream>
using namespace std;
```

```
class String {
    size_t len_; // Swapped members cause program crash (unhandled exception)
    char *str_;
public:
    String(char *s) : str_(strdup(s)), len_(strlen(str_)) { cout << "ctor: "; print(); }
    ~String() { cout << "dctor: "; print(); free(str_); }
    void print() { cout << "(" << str_ << ": " << len_ << ")" << endl; }
};

int main() {
    String s = "Partha";
    s.print();
    return 0;
}
```

- **len_ precedes str_ in list of data members**
- **len_(strlen(str_)) is executed before str_(strdup(s))**
- **When strlen(str_) is called str_ is still uninitialized**
- **Causes the program to crash as shown in the message box**

    d.print();
    return 0;
}

-----
ctor: 30/Jul/1961
30/Jul/1961
dtor: 30/Jul/1961
```

Program 14.06: Point and Rect Classes: Lifetime of Data Members or Embedded Objects

Module 14

Sourangshu
Bhattacharya

Objectives &
Outline

Lifetime
Examples

String

Date

Rect

Name & Address

CreditCard

Copy
Constructor

Call by value

Signature

Data members

Free Copy
Constructor

Copy
Assignment
Operator

Copy Pointer

Self-Copy

Signature

```
#include <iostream>
using namespace std;
```

```
class Point {
    int x_;
    int y_;
public:
    Point(int x, int y):
        x_(x), y_(y)
    { cout << "Point ctor: ";
      print(); cout << endl; }
    ~Point() { cout << "Point dtor: ";
              print(); cout << endl; }
    void print()
    { cout << "(" << x_ << ", "
      << y_ << ")"; }
};
```

```
int main() {
    Rect r (0, 2, 5, 7);

    cout << endl; r.print(); cout << endl;

    cout << endl;
    return 0;
}
```

- Attempt is to construct a Rect object
- That, in turn, needs constructions of Point data members (or embedded objects) – TL_ and BR_ respectively
- Destruction, initiated at the end of scope of destructor's body, naturally follows a reverse order

```
class Rect {
    Point TL_;
    Point BR_;
public:
    Rect(int tlx, int tly, int brx, int bry):
        TL_(tlx, tly), BR_(brx, bry)
    { cout << "Rect ctor: ";
      print(); cout << endl; }
    ~Rect() { cout << "Rect dtor: ";
              print(); cout << endl; }
    void print()
    { cout << "["; TL_.print(); cout
      << " "; BR_.print(); cout << "];"
    };
};
```

```
-----
Point ctor: (0, 2)
Point ctor: (5, 7)
Rect ctor: [(0, 2) (5, 7)]

[(0, 2) (5, 7)]

Rect dtor: [(0, 2) (5, 7)]
Point dtor: (5, 7)
Point dtor: (0, 2)
```

- We know:

`Complex c1 = {4.2, 5.9}; // or c1(4.2, 5.9)`
invokes

`Constructor Complex::Complex(double, double);`

- Which constructor is invoked for?

`Complex c2(c1);`

Or for?

`Complex c2 = c1;`

- It is the **Copy Constructor** that take an object of the same type and constructs a copy:

`Complex::Complex(const Complex &);`

- Consider the **function call mechanisms** in C++:
 - *Call-by-reference*: Set a reference to the actual parameter as a formal parameter. Both the formal parameter and the actual parameter share the same location (object)
 - *Return-by-reference*: Set a reference to the computed value as a return value. Both the computed value and the return value share the same location (object)
 - *Call-by-value*: Make a copy (clone) of the actual parameter as a formal parameter. This needs a **Copy Constructor**
 - *Return-by-value*: Make a copy (clone) of the computed value as a return value. This needs a **Copy Constructor**
- **Copy Constructor** is needed for **initializing the data members** of a UDT from an existing value

Name & Address

CreditCard

Copy
Constructor

Call by value

Signature

Data members

Free Copy
Constructor

Copy
Assignment
Operator

Copy Pointer

Self-Copy

Signature

- Signature of a *Copy Constructor* can be one of:

```
MyClass(const MyClass& other); // Common
                                // Source cannot be changed
MyClass(MyClass& other);       // Occasional
                                // Source needs to change
MyClass(volatile const MyClass& other); // Rare
MyClass(volatile MyClass& other);      // Rare
```

- None of the following are copy constructors, though they can copy:

```
MyClass(MyClass* other);
MyClass(const MyClass* other);
```

- Why the parameter to a copy constructor must be passed as Call-by-Reference?

```
MyClass(MyClass other);
```

The above is an infinite loop as the call to copy constructor itself needs to make copy for the Call-by-Value mechanism.

- If no copy constructor is provided by the user, the compiler supplies a *free* copy constructor
- Compiler-provided copy constructor, understandably, cannot initialize the object to proper values. It has no code in its body. It performs a *bit-copy*

Program 14.09: Complex: Free Copy Constructor

Copy Pointer

Self-Copy

Signature

```
#include <iostream>
using namespace std;

class Complex { double re_, im_; public:
    Complex(double re, double im) : re_(re), im_(im) // Constructor
    { cout << "ctor: "; print(); }
    //Complex(const Complex& c) : re_(c.re_), im_(c.im_) // Copy Constructor
    //{ cout << "copy ctor: "; print(); }
    ~Complex() { cout << "dctor: "; print(); }
    double norm() { return sqrt(re_*re_ + im_*im_); }
    void print() { cout << "|" << re_ << "+j" << im_ << "| = " << norm() << endl; }
};

void Display(Complex c_param) { cout << "Display: "; c_param.print(); }

int main() {
    Complex c(4.2, 5.3);    // Constructor - Complex(double, double)

    Display(c); // Free Copy Constructor called to copy c to c_param

    return 0;
}
```

User-defined CCtor

```
ctor: |4.2+j5.3| = 6.7624
copy ctor: |4.2+j5.3| = 6.7624
Display: |4.2+j5.3| = 6.7624
dctor: |4.2+j5.3| = 6.7624
dctor: |4.2+j5.3| = 6.7624
```

Free CCtor

```
ctor: |4.2+j5.3| = 6.7624
\\ No message from free CCtor
Display: |4.2+j5.3| = 6.7624
dctor: |4.2+j5.3| = 6.7624
dctor: |4.2+j5.3| = 6.7624
```

- User has provided no copy constructor
- Compiler provides free copy constructor
- Compiler-provided copy constructor performs bit-copy - hence there is no message
- Correct in this case as members are of built-in type

Program 14.11: String: User-defined Copy Constructor

```
#include <iostream>
#include <cstdlib>
#include <cstring>
using namespace std;
class String { public: char *str_; size_t len_;
    String(char *s) : str_(strdup(s)), len_(strlen(str_)) { } // ctor
    String(const String& s) : str_(strdup(s.str_)), len_(s.len_) { } // cctor
    ~String() { free(str_); } // dtor
    void print() { cout << "(" << str_ << ": " << len_ << ")" << endl; }
};
void strToUpper(String a) { // Make the string uppercase
    for (int i = 0; i < a.len_; ++i) a.str_[i] = toupper(a.str_[i]);
    cout << "strToUpper: "; a.print();
}
int main() {
    String s = "Partha";
    s.print();
    strToUpper(s);
    s.print();
    return 0;
}
---
```

(Partha: 6)
strToUpper: (PARTHA: 6)
(Partha: 6)

- User has provided copy constructor. So Compiler does not provide free copy constructor
- When actual parameter *s* is copied to formal parameter *a*, space is allocated for *a.str_* and then it is copied from *s.str_*. On exit from *strToUpper*, *a* is destructed and *a.str_* is deallocated. But in *main*, *s* remains intact and access to *s.str_* is valid.
- **Deep Copy:** While copying the object, the pointed object is copied in a fresh allocation. This is safe

class String { public: char *str_; size_t len_;
    String(char *s) : str_(strdup(s)), len_(strlen(str_)) { } // ctor
    //String(const String& s) : str_(strdup(s.str_)), len_(s.len_) { } // cctor
    ~String() { free(str_); } // dtor
    void print() { cout << "(" << str_ << ": " << len_ << ")" << endl; } };

void strToUpper(String a) { // Make the string uppercase
    for (int i = 0; i < a.len_; ++i) a.str_[i] = toupper(a.str_[i]);
    cout << "strToUpper: "; a.print(); }

int main() {
    String s = "Partha";

    s.print();
    strToUpper(s);
    s.print();

    return 0;
}
```

User-defined Cctor

```
(Partha: 6)
strToUpper: (PARTHA: 6)
(Partha: 6)
```

Free Cctor

```
(Partha: 6)
strToUpper: (PARTHA: 6)
(?????????????????????????????????: 6)
```

- User has provided no copy constructor. Compiler provides free copy constructor
- Free copy constructor performs bit-copy - hence no allocation is done for str_ when actual parameter s is copied to formal parameter a. s.str_ is merely copied to a.str_ and both continue to point to the same memory. On exit from strToUpper, a is destructed and a.str_ is deallocated. Hence in main access to s.str_ is corrupted. Program crashes
- **Shallow Copy:** With bit-copy, only the pointer is copied - not the pointed object. This may be risky

#include <cstdlib>
#include <cstring>
using namespace std;

class String { public: char *str_; size_t len_;
    String(char *s) : str_(strdup(s)), len_(strlen(str_)) { } // ctor
    String(const String& s) : str_(strdup(s.str_)), len_(s.len_) { } // cctor
    ~String() { free(str_); } // dtor
    String& operator=(const String& s) {
        free(str_); // Release existing memory
        str_ = strdup(s.str_); // Perform deep copy
        len_ = s.len_;
        return *this; // Return object for chain assignment
    }
    void print() { cout << "(" << str_ << ": " << len_ << ")" << endl; }
};

int main() { String s1 = "Football", s2 = "Cricket";
    s1.print(); s2.print();
    s2 = s1; s2.print();
    return 0;
}

---
(Football: 8)
(Cricket: 7)
(Football: 8)
```

- In copy assignment operator, `str_ = s.str_` should not be done for two reasons:
 - 1) Resource held by `str_` will leak
 - 2) Shallow copy will result with its related issues
- What happens if a self-copy `s1 = s1` is done?

Program 14.13: String: Self Copy

```
#include <iostream>
#include <cstdlib>
#include <cstring>
using namespace std;

class String { public: char *str_; size_t len_;
    String(char *s) : str_(strdup(s)), len_(strlen(str_)) { } // ctor
    String(const String& s) : str_(strdup(s.str_)), len_(s.len_) { } // cctor
    ~String() { free(str_); } // dtor
    String& operator=(const String& s) {
        free(str_); // Release existing memory
        str_ = strdup(s.str_); // Perform deep copy
        len_ = s.len_;
        return *this; // Return object for chain assignment
    }
    void print() { cout << "(" << str_ << ": " << len_ << ")" << endl; }
};

int main() { String s1 = "Football", s2 = "Cricket";
    s1.print(); s2.print();
    s1 = s2; s1.print();
    return 0;
}

---
(Football: 8)
(Cricket: 7)
(????????: 8) // Garbage is printed
```

- For self-copy `str_` and `s.str_` are the same pointers
- Hence, `free(str_)` first releases the memory, and then `strdup(s.str_)` tries to copy from released memory
- **This may crash or produce garbage values**
- **Self-copy must be detected and protected**

Program 14.14: String: Self Copy – Safe

- For class MyClass, typical copy assignment operator will be:

```
MyClass& operator=(const MyClass& s) {  
    if (this != &s) {  
        // Release resources held by *this  
        // Copy members of s to members of *this  
    }  
    return *this;  
}
```

- Signature of a *Copy Assignment Operator* can be one of:

```
MyClass& operator=(const MyClass& rhs); // Common  
                                           // No change in Source  
MyClass& operator=(MyClass& rhs);      // Occasional  
                                           // Change in Source
```

- The following *Copy Assignment Operators* are occasionally used:

```
MyClass& operator=(MyClass rhs);  
const MyClass& operator=(const MyClass& rhs);  
const MyClass& operator=(MyClass& rhs);  
const MyClass& operator=(MyClass rhs);  
MyClass operator=(const MyClass& rhs);  
MyClass operator=(MyClass& rhs);  
MyClass operator=(MyClass rhs);
```

- **Copy Constructors**

- A new object is created
- The new object is initialized with the value of data members of another object

- **Copy Assignment Operator**

- An object is already existing (and initialized)
- The members of the existing object are replaced by values of data members of another object

- **Deep and Shallow Copy for Pointer Members**

- Deep copy allocates new space for the contents and copies the pointed data
- Shallow copy merely copies the pointer value – hence, the new copy and the original pointer continue to point to the same data
