C++ Solution

Virtual
Function
Pointer Table

Summary

- Staff Salary Processing: RECAP
 - C Solution using Function Pointers
 - C++ Solution using Polymorphic Hierarchy
 - Comparison of C and C++ Solutions
- Virtual Function Table for Polymorphic Dispatch

Staff Salary Processing:

Problem Statement: RECAP (Module 29)

Module 31

Sourangshu
Bhattacharya

Objectives &
Outline

Staff Salary
Processing

C Solution

C++ Solution

Virtual
Function
Pointer Table

Summary

- An organization needs to develop a salary processing application for its staff
- At present it has an engineering division only where **Engineers** and **Managers** work. Every **Engineer** reports to some **Manager**. Every **Manager** can also work like an **Engineer**
- The logic for processing salary for **Engineers** and **Managers** are different as they have different salary heads
- In future, it may add **Directors** to the team. Then every **Manager** will report to some **Director**. Every **Director** could also work like a **Manager**
- The logic for processing salary for **Directors** will also be distinct
- Further, in future it may open other divisions, like Sales division, and expand the workforce
- **Make a suitable extensible design**

C Solution: Function Pointers

Engineer + Manager: RECAP (Module 29)

Staff Salary
Processing

C Solution

C++ Solution

Virtual
Function
Pointer Table

Summary

- How to represent **Engineers**, **Managers**, and **Directors**?
 - struct
- How to initialize objects?
 - Initialization functions
- How to have a collection of mixed objects?
 - Array of union
- How to model variations in salary processing algorithms?
 - struct-specific functions
- How to invoke the correct algorithm for a correct employee type?
 - Function switch
 - Function pointers

C Solution: Function Pointers

Engineer + Manager + Director

C Solution

C++ Solution

Virtual
Function
Pointer Table

Summary

```
#include <stdio.h>
#include <string.h>

typedef enum E_TYPE { Er, Mgr, Dir } E_TYPE;
typedef void (*psFuncPtr)(void *);

typedef struct Engineer { char *name_; } Engineer;
Engineer *InitEngineer(const char *name) { Engineer *e = (Engineer *)malloc(sizeof(Engineer));
    e->name_ = strdup(name); return e;
}
void ProcessSalaryEngineer(void *v) { Engineer *e = (Engineer *)v;
    printf("%s: Process Salary for Engineer\n", e->name_);
}
typedef struct Manager { char *name_; Engineer *reports_[10]; } Manager;
Manager *InitManager(const char *name) { Manager *m = (Manager *)malloc(sizeof(Manager));
    m->name_ = strdup(name); return m;
}
void ProcessSalaryManager(void *v) { Manager *m = (Manager *)v;
    printf("%s: Process Salary for Manager\n", m->name_);
}
typedef struct Director { char *name_; Manager *reports_[10]; } Director;
Director *InitDirector(const char *name) { Director *d = (Director *)malloc(sizeof(Director));
    d->name_ = strdup(name); return d;
}
void ProcessSalaryDirector(void *v) { Director *d = (Director *)v;
    printf("%s: Process Salary for Director\n", d->name_);
}
```

C Solution: Function Pointers

Engineer + Manager + Director

Processing

C Solution

C++ Solution

Virtual
Function
Pointer Table

Summary

```
typedef struct Staff {
    E_TYPE type_;
    void *p;
} Staff;

int main() {
    psFuncPtr psArray[] = { ProcessSalaryEngineer,
                           ProcessSalaryManager,
                           ProcessSalaryDirector };

    Staff staff[] = { { Er, InitEngineer("Rohit") },
                     { Mgr, InitEngineer("Kamala") },
                     { Mgr, InitEngineer("Rajib") },
                     { Er, InitEngineer("Kavita") },
                     { Er, InitEngineer("Shambhu") },
                     { Dir, InitEngineer("Ranjana") } };

    for (int i = 0; i < sizeof(staff) / sizeof(Staff); ++i)
        psArray[staff[i].type_](staff[i].p);

    return 0;
}
-----
```

Output:

```
Rohit: Process Salary for Engineer
Kamala: Process Salary for Manager
Rajib: Process Salary for Manager
Kavita: Process Salary for Engineer
Shambhu: Process Salary for Engineer
Ranjana: Process Salary for Director
```

C++ Solution: Polymorphic Hierarchy: RECAP

Engineer + Manager + Director: (Module 30)

C Solution

C++ Solution

Virtual
Function
Pointer Table

Summary

- Whenever a class defines a virtual function a hidden member variable is added to the class which points to an array of pointers to (virtual) functions called the **Virtual Function Table (VFT)**
- VFT pointers are used at run-time to invoke the appropriate function implementations, because at compile time it may not yet be known if the base function is to be called or a derived one implemented by a class that inherits from the base class
- VFT is class-specific – all instances of the class has the same VFT
- VFT carries the **Run-Time Type Information (RTTI)** of objects

C++ Solution

Virtual
Function
Pointer Table

Summary

- Leveraging an innovative solution to the Salary Processing Application in C using function pointers, we compare C and C++ solutions to the problem
- The new C solution is used to explain the mechanism for dynamic binding (polymorphic dispatch) based on virtual function tables
